

ECONOMIC SITUATION AND STRATEGY January 15, 2021

Inflation comeback?

Inflation has led a zombie-like existence for years. Although many economists, market participants, media commentators, politicians, companies, private individuals and central banks have fervently pursued this topic, inflation rate development has been mostly unspectacular. It has been so unremarkable that one might assume central banks had put inflation finally to rest with forward-looking monetary policy. In particular, prices have only risen very moderately since the 2008-2009 financial and economic crises, at a rate of about 1.5% on average in both the United States and the euro zone. The core inflation rate (excluding energy and food prices) has actually only climbed at an average of 1.3% in the same period.

However, there are different aspects of this "success" to consider from the standpoint of the central banks. Their objective (among others) is to ensure price level stability. Intuitively, one might think that is achieved at an inflation rate of zero. But that is not the case. For, it is definitely a positive from an economic standpoint if the value of money declines slightly as a rule. If economic

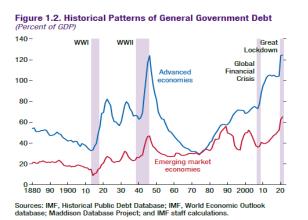

agents expect their money is going to be worth somewhat less in 12 months, there is (at least in theory) a greater incentive to spend it than if its value remained completely stable. For this reason, many central banks, including the US Federal Reserve (Fed) and the European Central Bank (ECB), have anchored their monetary policy reaction function to an inflation rate of 2%. However, both have mostly missed this target in the past years. The Fed drew consequences from that and decided last September to replace its exactly defined point target for inflation with a flexible, not further specified average target of 2%. It will tolerate a rise above that for a while, since the inflation rate level was previously too low. We consider it likely that the ECB will similarly modify its existing target (inflation near, but below 2%).

The Fed's new monetary policy strategy will have the effect that its key interest rate will stay at the current level even longer and only be raised later than would otherwise be the case, since the central bank will not have to raise interest rates in reaction to a short-term overshooting of the inflation target. Nevertheless, the yield on 10-year US Treasuries has advanced significantly in the past days. This is not due to increased speculation that monetary policy might be tightened sooner than most have expected, but rather to fears that inflation is making a comeback. This may be gathered from expectations about how inflation will develop in the next five years, which have increased to a rate somewhat above 2.3% for the United States. That is the highest in almost two years. Inflation expectations in the euro zone have also risen to almost 1.4%, their highest level in just over a year. One reason for this increase is

M.M.WARBURG & CO 1

the election of Joe Biden as US president and the Democratic Party's victories in two special US Senate elections in Georgia. That gives them 50 seats in the Senate, exactly the same number as the Republicans have. If there are tie votes, Vice President Kamala Harris will then have the deciding voice. Consequently, the new president's first acts in office are likely to include getting an extensive economic stimulus package passed, which will drive up US government debt further. More economic growth and higher debt, according to capital market logic, must lead to more inflation, especially if the Fed finances the new debt and for that reason leaves its policy interest rate untouched.

Will the inflation rate actually rise in the near future? The answer is clearly affirmative, but not because of accommodative monetary and fiscal policy or higher government debt. If this supposed interdependence actually existed, a strong and lasting rise of prices would have followed the 2008 collapse, since government debt has increased enormously since then. Instead, we have seen the exact opposite.

Source: IMF, Fiscal Monitor, October 2020

Contrary to what many expected and what monetarists postulated, strong money supply growth driven by the central banks did not lead to greater price acceleration. Instead, very high money supply growth has been accompanied by very low inflation rates in the past years.

Trend 1980-2020

Nevertheless, it is practically certain that inflation rates will rise in the coming months, at times even sharply. The obvious reason for this is the price of oil. After a steep decline last spring due to the pandemic, the price of crude oil has increased significantly in the last few months. If it should remain at the current level of about USD 56 per barrel (Brent), that would mean an approximate year-over-year doubling in April and May 2021. This effect alone will cause the inflation rate to rise by about two percentage points compared with the present level. In addition, Germany is raising its value-added tax at the beginning of the year, which will put the inflation rate above 2% at times from the spring onward. However, this price increase is solely due to a base effect and should not be mistaken for a lasting change of price acceleration. For, just as quickly as the specter of inflation appears, it will also disappear – and with it so will the bond market's worries about a significant yield surge. One should be careful with interest-bearing securities in the near term, though, and give preference to shorter duration.

This information does not constitute an offer or an invitation to submit an offer, but is solely intended to provide guidance and present possible business activities. This information does not purport to be complete and is therefore not binding. The information provided should not be considered a recommendation to purchase financial instruments individually, but serves only as a proposal for a possible asset allocation. The opinions expressed herein are subject to change without notice. Where statements were made with respect to prices, interest rates or other indications, these solely refer to the time when the information was prepared and do not imply any forecasts about future development, particularly regarding future gains or losses. In addition, this information does not constitute advice or a recommendation. Before completing any deal described in this information, a product-specific consultation tailored to the customer's individual needs is required. This information is confidential and exclusively intended for the addressee described herein. Any use by parties other than the addressee is not permissible without our approval. This particularly applies to reproductions, translations, microfilms, saving and processing in electronic media as well as publishing the entire contents or parts thereof.
